AI Usage Log - US-21 Dark Theme

Project: CareerConnect

Feature: US-21 - Dark Theme

Date: November 12, 2026

Branch: feature/dark-mode

Prompt / Request

“I’m implementing a dark theme for CareerConnect using SvelteKit and Tailwind CSS. I want users to switch between Light, Dark, and System themes through Settings, with their preference saved automatically. I also need help reviewing my existing components, fixing contrast issues, and keeping styling consistent across the application without affecting light mode. I’ll share my code and screenshots so you can suggest specific improvements.”

AI Response

AI provided guidance on configuring theme switching, managing user preferences through localStorage, and applying dark-mode styles with Tailwind CSS.

It reviewed shared components and suggested targeted improvements for contrast, buttons, dropdowns, logos, avatars, resume icons, and application statuses. It also assisted with constructing unit tests for the theme utility.

My Contributions

I implemented the theme-switching functionality, configured the colour variables, and added the theme options in Settings. I updated shared components and individual pages while keeping the existing light theme.

I manually reviewed the application, identified visual issues, and made the final design decisions, including charcoal backgrounds, logo styling, and colour-coded application outcomes. I applied and checked the code changes myself.

I added the dedicated theme test file, ran the automated tests and Svelte checks, and reviewed the results before preparing the feature for commit.

Outcome

Implemented Light, Dark, and System theme support with saved preferences and more consistent styling across CareerConnect. AI supported code review, troubleshooting, and test suggestions; I carried out implementation and verification.

Testing and Verification

US-21 theme unit tests: 8 passed, 0 failed. Full CareerConnect automated test suite: 109 passed, 0 failed. pnpm check: 0 errors and 0 warnings. Manual visual checks were also performed on multiple pages.

These automated tests verify the theme utility; they do not replace full browser-based testing of every page or live operating-system theme changes.
