AI Log - Job Offer Email Notification

Project: CareerConnect

Feature: Job Offer Email Notification

Date: November 11, 2026

Prompt / Request

Requested technical guidance and coding assistance for implementing an automated email notification when a recruiter sends a job offer to an applicant. The notification should contain a generic congratulatory message and a link to CareerConnect, where the job seeker can view the offer details and next steps.

The feature needed to integrate with the existing recruitment workflow and email infrastructure without affecting other application functionalities.

AI Assistance

- Helped plan the feature and structure its user story and acceptance criteria.
- Provided implementation suggestions and code examples for the email template and Resend integration.
- Assisted with determining where the notification should be triggered in the existing recruiter decision workflow.
- Reviewed code changes and suggested improvements to the email notification logic.
- Assisted in debugging syntax errors and resolving test compatibility issues involving SvelteKit environment modules.
- Suggested approaches for mocking dependencies during automated testing.
- Helped develop test cases for successful offers, rejections, duplicate decisions, and email failures.

My Contributions

- Defined the feature requirements and decided to keep offer details and further instructions on the CareerConnect website.
- Worked directly on the code, writing, modifying, and integrating the email notification functionality into the existing project.
- Adapted suggested code to fit the project's structure and existing application logic.
- Implemented changes to the email template, sending function, and recruiter decision workflow.
- Reviewed the code, identified issues, and made corrections during development.
- Worked on the automated tests, updated mocks, and resolved compatibility issues.
- Manually tested the feature using the application and confirmed successful email delivery.
- Ran the complete automated test suite and TypeScript checks to verify the implementation.
- Managed version control, committed the changes, and pushed the completed feature to a separate branch.

Result

Successfully developed and tested the Job Offer Email Notification feature. Job seekers now receive a congratulatory email when a recruiter submits a job offer, with a link directing them to CareerConnect for further details.

The implementation prevents emails from being triggered for rejections or duplicate decisions and ensures that email failures do not reverse saved job offers.

Verification Results

- 109 automated tests passed.
- 0 failed tests.
- 0 TypeScript errors or warnings.
- Successful manual email delivery test.
