AI Usage Summary - US-07: Company Profile

CareerConnect | Sprint 2 | AI tools: ChatGPT and GitHub Copilot

---

Summary of AI Usage

AI assisted with planning, code suggestions, explaining existing project structures, debugging, and test examples for US-07. ChatGPT provided guidance for the company profile database schema, SvelteKit forms and server actions, recruiter permissions, validation, autocomplete, job-posting integration, and profile presentation. GitHub Copilot provided limited assistance with debugging and preserving submitted form values.

Implementation and Student Contributions

The student manually implemented, reviewed, and adapted AI-suggested code in VS Code. The student chose to reuse CareerConnect's existing styling and components; requested company and location autocomplete; separated the company overview from the edit form; placed Company Profile under Settings; and revised the Edit Profile link and overall layout. The student also inspected the shared Supabase schema and aborted an unsafe Drizzle operation before manually creating the company table with row-level security enabled.

Testing and Verification

The student executed the development commands, investigated SvelteKit-generated type errors, corrected test import paths, tested profile creation and editing, and ran the automated checks. The reported final results were 36 tests passed, 0 failed, and 0 Svelte/TypeScript errors or warnings. These unit tests do not independently establish complete end-to-end authorization coverage.

AI Contribution Disclosure

AI contributed substantial initial code examples, design ideas, debugging suggestions, and test cases. The student integrated and modified the suggestions, made the implementation decisions, ran the tests, examined the results, and performed Git operations. It would not be accurate to claim that all code was written without AI assistance.

Version Control

Branch: US-07-company-profile
Commit: 3d43a8f - US-07: implement company profile management

Conclusion

US-07 was developed through a combination of AI-assisted guidance and code suggestions, student-directed implementation, manual debugging, and testing. Future ideas such as public company search, company verification, and full street-address lookup were discussed but not included in the completed feature.
