

Task ID/Title

AI-assisted generation of a unique CareerConnect user story

Purpose of AI Use

Brainstorming and user story generation.

Prompt Used

Suggest a unique but manageable user story for CareerConnect that is not one of the main required features. The feature should be useful to job seekers or recruiters. Please include a suggested priority, sprint, acceptance criteria, and implementation tasks.

AI-Suggested Content

The AI suggested a Company Reviews feature where CareerConnect users can read and submit reviews about companies based on previous work experiences.

Priority: Low

Sprint: TBD

User Story:

As a CareerConnect user, I want to read and submit reviews about companies so that I can learn from the experiences of people who have worked there before applying.

Acceptance Criteria

- A signed-in user can view reviews for a company.
- A signed-in user can submit a review with a rating and written feedback.
- Reviews are linked to the correct company.
- The user can edit or delete their own review.
- The average company rating is displayed.
- The platform states that reviews are user-submitted and are not independently verified.

Implementation Tasks

- Task 1.1: Create a company reviews table in the database.
- Task 1.2: Create a form for submitting reviews.
- Task 1.3: Display reviews on the company page.
- Task 1.4: Calculate and display the average rating.
- Task 1.5: Allow users to edit or delete their own reviews.
- Task 1.6: Test review submission, ownership, and validation.

Validation

The suggestion was reviewed against the CareerConnect project scope and considered technically manageable because it mainly requires a review form, database storage, company-linked reviews, and basic validation.

Decision

Modified before use.

The priority was set to **Low** because company reviews are useful but are not part of the core CareerConnect workflow required for the main platform functionality.

Reflection

The AI helped transform a general idea into a structured user story with acceptance criteria and implementation tasks. The final priority and inclusion of the feature were still decided by the team.
