AI Prompt — US-15: Job Applications

I am working on **CareerConnect**, a job recruitment platform developed using SvelteKit, TailwindCSS, Better Auth, Drizzle ORM, and Supabase/PostgreSQL.

I need help implementing **US-15: Job Applications**, while maintaining the project's existing architecture, database schema, authentication system, UI design, and coding conventions.

User Story:

As a job seeker, I want to apply to job postings using my uploaded resume so that recruiters can review my application.

Requirements

1. Allow authenticated job seekers to apply to published, open job postings.
2. Allow applicants to select a resume they previously uploaded.
3. Verify that the selected resume belongs to the logged-in job seeker.
4. Save applications in the database, linking the applicant, job posting, and resume.
5. Prevent users from applying more than once to the same job.
6. Display a confirmation after successful submission.
7. Allow recruiters to view applications submitted to their own job postings, including applicant names, emails, application dates, and resumes.
8. Allow recruiters to view submitted PDF resumes securely.
9. Prevent recruiters from viewing applications belonging to other recruiters' postings.
10. Restrict resume access to its owner and recruiters who have received that resume through an application.
11. Allow job seekers to withdraw their applications while the posting remains open and before its deadline.
12. Remove withdrawn applications without deleting the uploaded resume.
13. Allow job seekers to reapply after withdrawing.
14. Revoke recruiter access to withdrawn resumes unless another valid application authorizes access.

Implementation Instructions

- Preserve existing features and avoid overwriting teammates' work.
- Follow the existing SvelteKit routing structure and Drizzle ORM schema.
- Reuse the existing authentication and authorization system.
- Maintain the website's TailwindCSS styling.

- Add appropriate server-side validation and permission checks.
- Keep resume files in private storage.
- Avoid introducing unnecessary dependencies.
- Implement the feature step by step and explain which files need modification.

User Suggestions and Contributions

- I suggested adding an application withdrawal feature so job seekers could cancel their applications and reapply before the deadline.
- I worked on the application submission form, recruiter applicant viewing, and secure PDF access.
- I integrated the suggested code into the existing project and adjusted it to maintain compatibility with my teammates' work.
- I manually tested the features using different job seeker and recruiter accounts, including duplicate applications, withdrawal, and unauthorized resume access.
- I verified application records in Supabase and confirmed that recruiters lose access to resumes after withdrawal when no other valid application authorizes access.
- I worked on debugging issues, correcting code, and validating the implementation.
- I ran 56 automated tests, including six withdrawal tests, and confirmed zero Svelte errors and warnings.
- I reviewed, committed, and pushed my changes to the shared GitHub branch.
