CareerConnect: Sprint 2 Summary Report

SOEN 341 Software Process, Fall 2026, Lab FM.

Team: Paul Fourment, Mohamad Alosta, Michael Derocher, Kimia Karimiyeganeh, Maher Waez.

Sprint 2: September 29 to October 26, 2026.

Sprint Objectives

Build the core features of CareerConnect on top of the Sprint 1 accounts and profiles: resume management, job search and job details, and job applications with status tracking, among other features. We also aimed to start the recruiter dashboard, write acceptance tests for every Sprint 1 and Sprint 2 user story completed, and set up a continuous integration (CI) pipeline.

Features and Functionality Implemented

- **Accounts:** email verification (US-08) and a forgot-password flow with expiring email codes (US-17).
- **Resumes:** upload, replace, delete and view PDF resumes, stored privately (US-10, US-11).
- **Recruiter job postings:** create, edit and delete postings with company and city autofill, plus a "Your postings" view (US-12, US-13).
- **Job listing and details:** open, closed and draft status, requirements, deadline, salary ranges and acceptance rate; unpublished jobs are hidden from job seekers (US-05).
- **Job search:** find jobs by keyword, company or location, and narrow them down by job type and work mode (US-14).
- **Company profiles:** shown on each recruiter's job postings (US-07).
- **Applications:** job seekers apply with one of their resumes, can withdraw before the deadline, and follow each application's status on My Applications. Recruiters see who applied and open their resumes (US-15, US-20).
- **Quality:** a GitHub Actions CI pipeline runs the type check and unit tests on every pull request; acceptance tests are labeled GitHub issues linked to their stories.
- **Still in progress:** the AI resume feature (#91).

Team Innovation and Original Features

- **Clear application outcome messages (US-03):** to stop "ghosting", a recruiter must send either an offer with the next steps or a rejection with at least 100 characters explaining their decision. The system never invents reasons, and recruiters are reminded about applications unanswered after 7 days.
- **Acceptance rate (US-05):** each job shows how many applications got an offer, so job seekers can judge their chances.
- **Generative AI:** AI-assisted resume autofill and review that suggests how to improve a resume's clarity and relevance (#91).
- **New team stories:** forgot password (US-17), recruiter verification (US-18) and application status tracking (US-20).

Challenges and Resolutions

- **Blocked dependencies:** outcome messages, status tracking and the acceptance rate all depend on job applications (US-15), which had no owner. We split US-15 between two members and made status tracking its own story (US-20).
- **New technology:** most of the team was new to SvelteKit and Drizzle. We reused existing features as patterns and reviewed each other's pull requests.
- **Overlapping changes:** several stories edit the same job pages and database tables, so we merge related pull requests in order (for example, US-05 before US-14).
- **No automatic checks:** broken code could reach the main branch unnoticed, so we added the CI pipeline.

Team Contributions

- **Paul Fourment:** resume upload and management, email verification fixes, autofill APIs, AI resume feature.
- **Mohamad Alosta:** job browsing and details (US-05), job search (US-14), outcome messages (US-03), the application table and fixes (US-15), CI pipeline, acceptance tests, sprint plan, task breakdown, contribution log, meeting minutes.
- **Maher Waez:** email verification (US-08), forgot password (US-17), company profile (US-07), applying for and viewing applications (US-15).
- **Michael Derocher:** job posting creation and management (US-12, US-13) and their tests, code reviews.
- **Kimia Karimiyeganeh:** application status tracking and the My Applications page (US-20).
- **Andrew Rowe:** dropped the course during the sprint.
